Panel Urges Study Of UFO Reports

Unexplained Phenomena Need Scrutiny, Science Group Says

By KATHY SAWYER
Washington Post Staff Writer

Some supposed UFO sightings have been accompanied by unexplained physical evidence that deserves serious scientific study, an international panel of scientists has concluded.

In the first independent scientific review of the controversial topic in almost 30 years, directed by physicist Peter Sturrock of Stanford University, the panel emphasized that it had found no convincing evidence of extraterrestrial intelligence or any violation of natural laws.

But the panel cited cases that included intriguing and inexplicable details, such as burns to witnesses, radar detections of mysterious objects, strange lights appearing repeatedly in the skies over certain locales, aberrations in the workings of automobiles, and radiation and other damage found in vegetation.

The 50-page review, being released today, asserts that the scientific community might learn something worthwhile if it can overcome the fear of ridicule associated with the topic and get some funding for

See UFO, A7, Col. 1

Study of UFO-Related Phenomena Urged

UFO, From A1

targeted research to try to explain these occurrences.

"It may be valuable to carefully evaluate UFO reports to extract information about unusual phenomena currently unknown to science," the report stated, adding that such research could also improve understanding of, and in some cases debunk, supposed UFO events.

For example, Earth science researchers have eventually accepted several phenomena "originally dismissed as folk tales," including meteorites and certain types of lightning, the panel noted.

The findings are from a four-day workshop held in Tarrytown, N.Y., followed by a second three-day meeting in San Francisco, both last fall. The results are published in the current issue of the *Society for Scientific Exploration*, which was established by Sturrock.

The inquiry involved scientists from the Massachusetts Institute of Technology, Cornell and Princeton universities, the universities of Arizona and Virginia, and institutions in France and Germany, among others. A panel of nine physical scientists analyzed presentations by eight UFO investigators, who were encouraged to present their strongest evidence. The project was funded by Laurance S. Rockefeller through his LSR Fund because of a belief, the report said, that "the problem is in a very unsatisfactory state of ignorance and confusion."

The panel suggests the scientific community has suffered a failure of curiosity regarding UFOs. Despite an abundance of reports over the last 50 years, "and despite great public interest, the scientific community has shown remarkably little interest in this topic."

Asked about the conclusions, a sampling of scientists and officials outside the panel expressed surprise that a topic with such a high "giggle factor" might be reincarnated for serious study, possibly further blurring the lines between legitimate research and the "lunatic fringe." Some said they would never comment on the touchy topic, and some said they would reserve judgment until they had read the report.

In a telephone interview, Sturrock said that he hopes at least some scientists "will read the report and become curious. . . . The challenge is to do good science on this issue. It's difficult."

Some reported UFO incidents could have been caused by rare natural phenomena, such as electrical activity high above thunderstorms, or other known physical effects, the panel found. But there were some phenomena they could not easily explain.

The existing evidence from past cases is unlikely to produce either a solid debunking or other satisfactory explanation of the reports, the panel found. But "new data, scientifically acquired and analyzed (especially of well-documented, recurrent events) could yield useful information." The panel urged the scientific community to take UFO "evaluations must take place with a spirit of objectivity and a willingness to evaluate rival hypothe-

ses" that so far has been lacking, the report said.

Among the potentially fruitful areas of investigation the panel cites are:

- Physical effects on witnesses. Burns, or sensations of heat, and eye problems are the most frequently reported forms. The available evidence, though sparse, suggests microwave, infrared, visible and ultraviolet radiation, although "a few cases seem to point toward high doses of ionizing radiation, such as X-rays or gamma rays."
- Radar detections of UFOs. Scientific study would require the cooperation of military authorities. An example occurred in January 1994, in the skies above Paris, when an airborne crew saw "a gigantic disk" more than 3,000 feet in diameter. The disk was detected on military radar for 50 seconds, slowed abruptly from 110 knots to zero, then disappeared.

■ Semi-regular sightings of strange lights (such as those in Hessdalen, Norway, and Marfa, Tex.), in some cases accompanied by reports of disembarking objects. A possible example occurred in Ohio in 1973. A number of witnesses, both on the ground and in an Army Reserve helicopter, saw lights, including a powerful green light, and a bright white starburst. On one occasion, the starburst reappeared and again illuminated the set for descent. Scientists apparently failed to investigate the one item of physical evidence—a magnetic compass that had begun to spin during the event and was subsequently removed because it was unserviceable.

■ Injuries to vegetation and other ground traces. In a 1981 case in Trans-en-Provence, France, a witness reported an ovoid object emitting a low whistle as it flew in for a landing. Police and special UFO researchers found two concentric circles and other traces that, when subjected to laboratory analysis, showed the soil had been heavily compacted, though without major heating, and there were symptoms of aging in the plants there. A toxicologist concluded that some, though not all, of the effects could have been caused by powerful microwave radiation.

The Sturrock group said that because of advances in knowledge and technical capability, chances of significant learning are greater now than 30 years ago when the Air Force and the CIA supported a two-year investigation by the Colorado Project, directed by Edward U. Condon. That 1968 report concluded that "further extensive study of UFOs probably cannot be justified in the expectation that science will be advanced."

The Air Force last year made public its latest report on the infamous 1947 incident near the town of Roswell, N.M., which gave rise to a whole flying-saucer culture of paranoia, up to and including the fictional television program "The X-Files." Titled "The Roswell Report: Case Closed," that report, like the Sturrock panel, reiterated earlier conclusions that there is no evidence of aliens or their spaceships.

TRIAL & ERROR

NASP, 1986

Shortly after the Challenger disaster in 1986, President Ronald Reagan launched the National Aerospace Plane (NASP) project. It was to take off like an airplane from a conventional runway and fly straight into orbit, burning semi-frozen "slush" hydrogen in a revolutionary new supersonic combustion ramjet (scramjet) engine. By 1992 it was clear that the scramjet idea was ahead of its time—nobody knew whether the engine could operate at the hypersonic speeds that it had to in order for NASP to work. The project was scaled back, then canceled in 1993.

Delta Clipper, 1991

McDonnell Douglas began this effort in the late 1980s. In addition to being a reusable space vehicle, the Delta Clipper would have been a key component of the Star Wars missile-defense program. The reusable rocket, shaped like an inverted ice-cream cone, took off and landed vertically. A low-speed test vehicle was built for some experimental hops, but when Star Wars was scaled back, Delta Clipper lost most of its funding. The test vehicle was destroyed in an accident in 1996.

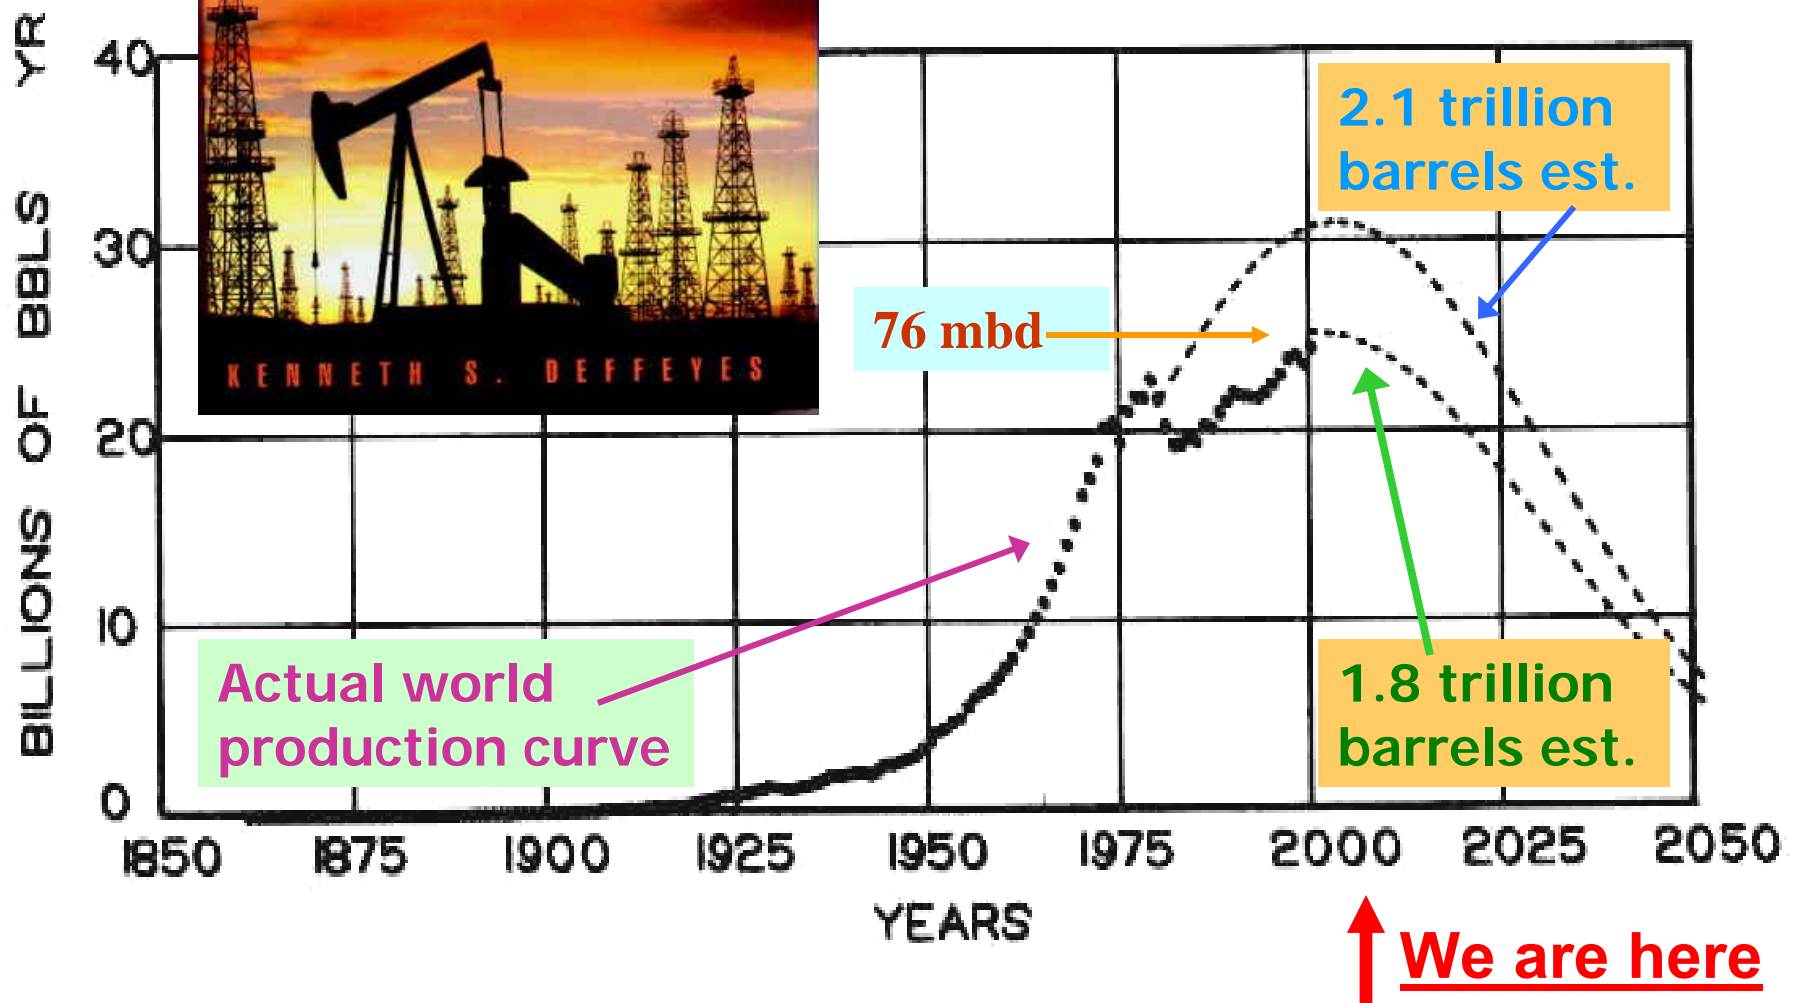

X-33, 1996

Lockheed Martin won the right to build the prototype X-33 in 1996. It was a wedge-shaped "lifting-body" vehicle that took off vertically like a rocket and landed like an airplane, and it had a unique "linear aerospike" rocket engine arrayed across its tail. The challenge was making the vehicle light enough to carry a payload in addition to the fuel needed to reach orbit. To do this, Lockheed Martin counted on carbon-fiber-composite tanks of liquid hydrogen. These proved too hard to build with current technology, and after a series of problems the X-33 was canceled in early 2001.

World Oil Production

Peak expected on or before 2010, like US 1970 peak, to which it never returns

“We’re pretending that business as usual will supply all our needs. But there’s an impending oil crisis we’re basically seeing, that will actually bite us sooner than we’re expecting it and it’s better to prepare for it now.”

Inhomogeneous magnetic fields ($dB/d\theta$) create the **circumferential force (F)**

Inhomogeneous Magnetic Fields

The Stern–Gerlach Experiment and Electron Spin

Modern Physics, Schaumm's Outline Series, Gautreau , McGraw Hill, 1978

In the *Stern–Gerlach experiment*, performed in 1921, a beam of silver atoms having zero total orbital angular momentum passes through an *inhomogeneous* magnetic field and strikes a photographic plate, as shown in Fig. 21-1. Any deflection of the beam when the magnetic field is turned on is measured on the photographic plate.

Their experimental setup: The magnetic field B is more intense near the pointed surface at the top than near the flat surface below, creating a slope in a graph of B vs. z , which is the gradient dB/dz .

Fig. 21-1

The purpose of the *inhomogeneous* magnetic field is to produce a deflecting force on any magnetic moments that are present in the beam. If a homogeneous magnetic field were used, each magnetic moment would experience only a torque and no deflecting force. In an inhomogeneous magnetic field, however, a net deflecting force will be exerted on each magnetic moment μ_z . For the situation of Fig. 21-1,

$$F_z = \mu_z \cos \theta \frac{dB}{dz} \quad (21.1)$$

where θ is the angle between μ_z and B , and dB/dz is the gradient of the inhomogeneous field

Physicists Confirm Power of Nothing, Measuring Force of Quantum 'Foam'

Fluctuations in the vacuum are
the universal pulse of existence.

By MALCOLM W. BROWNE

FOR a half century, physicists have known that there is no such thing as absolute nothingness, and that the vacuum of empty space, devoid of even a single atom of matter, seethes with subtle activity. Now, with the help of a pair of metal plates and a fine wire, a scientist has directly measured the force exerted by fleeting fluctuations in the vacuum that pace the universal pulse of existence.

The sensitive experiment performed at the University of Washington in Seattle by Dr. Steve K. Lamoreaux, an atomic physicist who is now at Los Alamos National

Laboratory, was described in a recent issue of the journal *Physical Review Letters*. Dr. Lamoreaux's results almost perfectly matched theoretical predictions based on quantum electrodynamics, a theory that touches on many of the riddles of existence and on the origin and fate of the universe.

The theory has been wonderfully accurate in predicting the results of subatomic particle experiments, and has also been the basis of speculations verging on science fiction. One of the wilder ones is the possibility that the universal vacuum — the ubiquitous empty space of the universe — might actually be a false vacuum.

If that were so, something might cause the present-day universal vacuum to collapse to a different vacuum of a lower energy. The effect, propagating at the speed of light, would be the annihilation of all matter in the universe. There would be no warning for humankind; the earth and its inhabitants would simply cease to exist at

Historical Antigravity Research

Guidelines to Antigravity*

ROBERT L. FORWARD

Hughes Research Laboratories, Malibu, California

(Received 12 September 1962)

This paper emphasizes certain little known aspects of Einstein's general theory of relativity. Although these features are of minor theoretical importance, their understanding and use can lead to the generation and control of gravitational forces. Three distinctly different non-Newtonian gravitational forces are described. The research areas which might lead to methods for the control of gravitation are pointed out and guidelines for initial investigation into these areas are given.

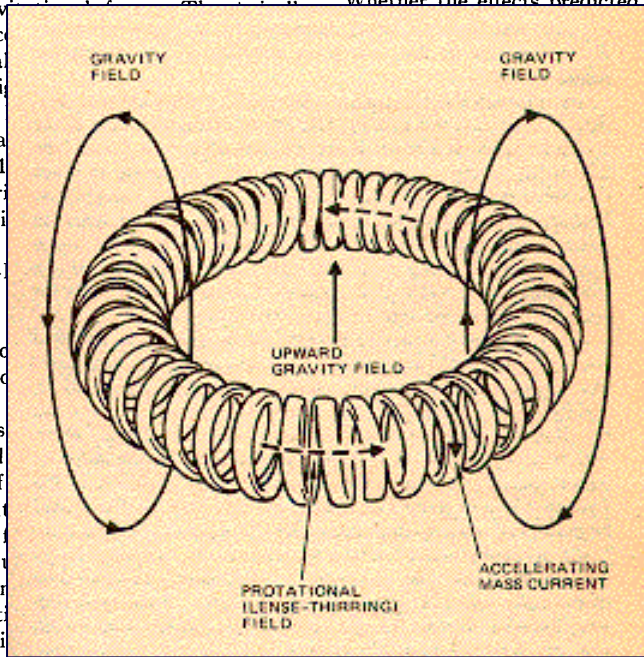

INTRODUCTION

EINSTEIN'S general theory of relativity provides a number of ways to generate non-Newtonian gravitational forces. All of these forces are of the same order of magnitude as a form of anti-gravity. They were probably first described by Einstein in his paper published in 1911. Einstein's theory of relativity in 1915 was derived by Thirring and has been contained in his paper on relativity.³⁻⁵

Although non-Newtonian, these forces were little known to the theorists of the time. It was for this reason that a detailed discussion of their effects would be of interest.

The equations of the general theory of relativity predict the usual force behavior of a stationary test body, but they also predict that a mass can create a field similar to the gravitational field, although the forces, although they result in a stationary field, they result in a stationary field.

field relations similar to the Maxwell relations. Thus one can use intuitive pictures from electromagnetic theory to design theoretical models. Whether the effects predicted by the linearized theory, have to be compared with the usual Newtonian theory, these unusual forces are independent of the forces are, in the usual New-

GRAVITATIONAL FORCES ON STATIONARY BODIES

From the theory of relativity it can be shown that a stationary body contains terms of the order of the body. One can rigorously investigate the behavior of a body in the x - y plane, on a stationary field approximately

$$z = - (MG\omega^2/c^2R)z, \quad (1)$$

* This paper was submitted as an essay to the Gravity Research Foundation in 1962 and received the Second Award.

ALTERNATIVE SCIENCE

Recently, two 1956 military documents, "Electrogravitics Systems" and "The Gravitics Situation," originally published by the Gravity Research Group of London (Special Weapons Study Unit), were declassified. Outlining T. Townsend Brown's antigravity discovery (see *Atlantis Rising*, Number 22, p. 35), and the subsequent Project Winterhaven, they were a vital new chapter in aviation research. For example, the documents state, "Unlike the turbine engine, electrogravitics is not just a new propulsion system, it is a new mode of thought in aviation and communications, and it is something that may become all-embracing."

To explain, "electrogravitics" is the science of using high-voltage electricity to provide propulsive force to aircraft or spacecraft of certain geometries. Or as Jeanne Manning explains, "The apparatus is pulled along by its self-generated gravity field, like a surfer riding a wave." Its discovery is often credited to Thomas Townsend Brown, a physicist who was encouraged by his professor, Dr. Paul Biefeld, a former classmate of Albert Einstein. However, there are those who say that Professor Francis Nipher's experiments, electrically charging lead balls, published in the *Electrical Experimenter*, in 1918, predates Biefeld/Brown. Unknown to many unconventional propulsion experts, T. Townsend Brown's electrogravitics work after the war involved a multinational project. American companies such as Douglas, Glenn Martin, General Electric, Bell, Convair, Lear, and Sperry-Rand participated in the research effort. Countries such as Britain, France, Sweden, Canada, and Germany also had concurrent projects from 1954 through 1956.

Furthermore, through the investigative effort of Dr. Paul LaViolette (read Len Kasten's article on LaViolette's research on pulsars elsewhere in this issue), it has become clear that electrogravitics became an integral part of the B-2 Stealth Bomber today, giving it an

Propulsion theories of UFOs are topics of books, journals, videos, DVDs, TV shows, patents, and articles

The Antigravity Research of T. Townsend Brown

Many readers may recall the name of T. Townsend Brown (mentioned briefly in the previous article) as it was historically associated with UFOs. Brown was the first director of the now-defunct—but once very active—National Investigations Committee on Aerial Phenomena (NICAP), a Washington, D.C.-based lobby group that was very instrumental in the 1960s for getting congressional leaders interested in the UFO mystery. But what the majority may not realize was that Brown was also a very highly acclaimed physicist who held many patents and worked on a variety of highly classified projects.

It may well have been that Brown served as a very important "link" between the UFOlogical community and work being done in the 40s and 50s on what in scientific circles is best known as "Electrogravitics

Systems." There are even some who suggest that Brown's work in this field may have been assisted by his knowledge of the crash landing of a spaceship near Roswell, New Mexico. Because of his close dealings with the government and many private aerospace firms (both in the United States and abroad) he would have easily had access to knowledge considered to be on the "cutting edge."

According to Thomas Valone, a licensed professional engineer and head of the Integrity Research Institute (1377 K Street, N.W., Washington, D.C. 20005), some of Brown's early patterns showed designs that look very much like the familiar "flying saucer" seen throughout North America during this time period. In fact, in the group's recently published report titled *Electrogravitics Systems—Reports on a New*

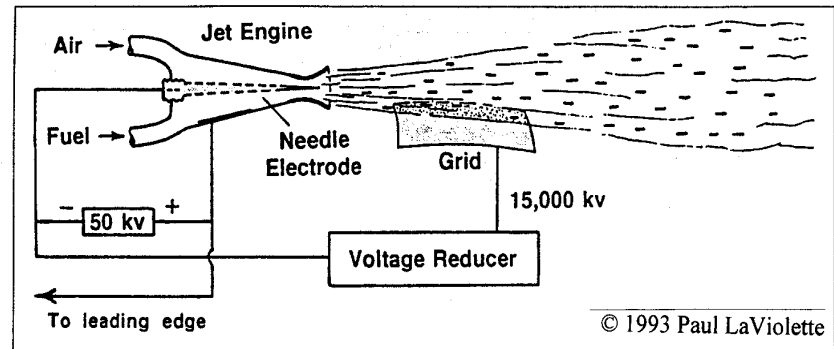

Propulsion Methodology, Valone sees a very strong tie between Brown's discoveries and the development of the B-2 Stealth Bomber.

"There is," he says, "substantial evidence that the electrogravitics research of the 1950s actually resulted in the B-2 Stealth Bomber auxiliary propulsion system." In the report, an article by Dr. Paul LaViolette is summarized further reach these conclusions:

1. The B-2 charges the leading edges of its wing-like body, with high voltage;
2. The B-2 is shaped just like T.T. Brown suggested an electrogravitic craft should look, for maximum charge separation;
3. Northrup tested leading-edge charging in 1968;
4. T.T. Brown suggested that the craft should be powered by a flame-jet generator like the

A version of the flying disc design that Brown proposed for development under Project Winterhaven.

A high-voltage flame-jet generator.

5. *Aviation Week* admits the existence of "dramatic, classified technologies" applicable to "aircraft control and propulsion" on the B-2;
6. *Aviation Week* also disclosed that the ceramic RAM on the B-2 outer skin is powdered depleted uranium, which just happens to have a dielectric constant of three times that of the high-K dielectrics tested in the 1950s (barium titanate oxide);
7. The B-2's Emergency Power Units (EPU) can work at high altitudes or even in space, driving an electrical generator;
8. Edward Aldridge, the Secretary of the Air Force, admits that the B-2 creates *no vapor trail* at high altitudes.
9. The decomposed gases from

the EPU's can function as the ion-carrying medium, according to T.T. Brown.

From this point it is not hard to reach out even further and safely conclude that a great deal of what is going on inside Area 51 (Nevada's top secret military base) is based upon the work of Brown and others who long ago saw another way to reach the stars besides utilizing rockets that need very heavy fuel payloads.

After reading the available literature, even seasoned scientists have had to agree that Brown's propulsion methods may be our best bet in reaching out to the planets in our solar system that we might possibly be able to visit even now if these discoveries were not being kept under lock and key by those few who would deem it necessary to utilize this valuable knowledge for their

own private gain.

John Searl's Work

British engineer John Searl claims to have built over 50 versions of his own "flying saucer," and has been receiving media attention—no matter how limited—for a number of years with his claims of having developed a noiseless, propulsion-free, levity disc that requires no fuel and flies vertically when taking off and landing. Searl even makes the bold claim that one of his craft actually flew around the world several times in the early 1970s...apparently without detection. It's claimed that "ultra-high voltage electro-static force fields are developed by segmented rings rotating in the disc's periphery. The craft's direction is controlled by varying voltage around the edge, thus producing unbelievable speed and agility."

The Searl Levity Disk...a man-made Flying Saucer goes aloft.

A capacitor module system is provided for creating a thrust force. The system includes a capacitor module provided with a first conductive element having a cylindrical geometry. The first conductive element can be a hollow cylinder or a solid cylinder. The capacitor module also includes a second conductive element axially spaced from the first conductive element and of smaller axial extent. The second conductive element can be a flat disk, a dome, or a conductive tip at the end of a dielectric rod. A dielectric element is disposed between the first conductive element and the second conductive element. The system also includes a high voltage source having first and second terminals connected respectively to the first and second conductive elements. The high voltage source applies a high voltage to the conductive elements of sufficient value to create a thrust force on the module inducing movement thereof.

Able to Go 'Where We Want'

New 'Air Dream—Planes Flying Outside Gravity

This is the third of a series of three articles on new pure and applied research into the mysteries of gravity and the efforts to devise ways to overcome it.

By Ansel E. Talbert
 Military and Aviation Editor

The current interest in America's aircraft and electronics industries in finding out whether gravity can be controlled or "cancelled out" is not confined to imaginative young graduates of engineering and scientific schools.

Some of the two industries'

most experienced and highly regarded leaders today are engaged directly or deeply interested in theoretical research relating to gravity and universal gravitation. Their basic aim is eventually to build "hardware" in the shape of planes, earth satellites and space ships "which can go where we want and do what we want without interference from gravity's mysterious trans-spatial pull."

Bell Is Optimistic

To the Stars

Zero point energy emerges from realm of science fiction, may be key to deep-space travel

WILLIAM B. SCOTT/AUSTIN, TEX.

At least two large aerospace companies and one U.S. Dept. agency are betting “zero point energy” could be the next breakthrough in aerospace vehicle propulsion, and are backing those bets with seed money for research.

If their efforts pay off, ZPE powerplants might enable Mach 25 hypersonic aircraft, quiet 1,200-seat hypersonic transporters that fly at 100-mi. altitudes and cover 12,000 mi. in about 70 min., and even trips to the Moon.

ONE OF THOSE companies, Boeing, has teamed with the U.S. Dept. of Defense to launch “Project Greenglow” in 1986 “to provide a focus for research on novel propulsion systems and the technologies to power them,” said R.A. Evans, the project leader, in a technical paper last year. Although funding levels have been modest, Greenglow is exploring ZPE as one element

NASA BPP/LES BOSSINAS

PE-relativistic energy is difficult to harness, and is difficult to harness by meticulous

Spacecraft capable of interstellar travel will approach the speed of light, and may have to extract energy from the vacuum of space. However, researchers could be years or decades from achieving the breakthroughs necessary to build such a propulsion system.

cowatts of power. That still leaves some critical questions. Still, the government
